Do Documents And Code Block Your Workflows?

Manual document extraction and inflexible, legacy systems hinder the performance of many core workflows in banking, insurance, and government. Lack of automation underpinned by document-oriented processes and rigid tech stacks increase costs, raise risks, and deteriorate client and employee experiences.

Leveraging Eigen Technologies AI-powered software, rapidly extract and accurately process information from documents at scale. When combined with Unqork's codeless application development platform, organizations can rapidly build and effectively power complex data extraction and decisioning workflows to create seamless customer and employee experiences.

Armed With Eigen + Unqork, Organizations Can:

GAIN QUALITATIVE INSIGHTS

Example: **End-to-End Insurance Underwriting**

Rising macro risks and the increasing volume of submissions strains underwriters. Automate submission triage to give underwriters the time to review all submissions and grasp every revenue opportunity.

AUTOMATE & OPTIMIZE COMPLEX WORKFLOWS

Example: **Loan Operations**

Hindered by paper-based processes and disparate systems, many financial services institutions lack the ability to scale loan operations. Digitize loan operations by automating the data extraction, enrichment and downstream distribution of complex credit agreements to core systems.

ADAPT TO CHANGES RAPIDLY

Example: **Contract Compliance**

Market tumult forces organizations to nimbly reconcile executed account actions against permitted contracted activities. Automatically cull guidance requirements for specific clients from signed documents and implement restrictions to account activity.

SUCCESS STORY

Leading Global Alternative Asset Manager Automated Bank Loan Notice Processing

Challenge

With data located in disparate systems and in documents that were not machine readable, a leading global alternative asset manager needed to reduce the manual and time consuming effort required to extract and process data from over 10,000 loan notices annually.

Solution

Using Eigen and Unqork, this asset manager built an application to automate end-to-end loan notice ingestion and processing, seamlessly connecting enriched data to downstream systems — all without writing a single line of code.
