# Unqork for Government

Rapidly build and effectively manage mission-critical software without writing, managing, or even seeing a line of code

Unqork for Government is the first no-code platform for the enterprise and is currently listed as FedRAMP Moderate in-process on the FedRAMP Marketplace. Unqork for Government was designed to support a Codeless Architecture and empower agencies to flexibly adjust their digital infrastructure and eliminate the complexity & cost of traditional code-based development.

Just as agencies routinely tap cloud providers (e.g., AWS, Microsoft Azure, Google Cloud) to abstract their physical cloud infrastructure into a configurable dashboard, **Unqork for Government abstracts the application technology stack into configurable visual components** representing user-facing elements, application logic, and integrations. Robust applications are developed, iterated, and managed in a completely visual UI.

- **Security-first:** Unqork's pressure-tested no-code platform has security, compliance, and reliability at its core
- **Focused on Federal:** Unqork's development has been informed by decades of collective government IT experience and is currently listed as FedRamp Moderate in-process on the FedRAMP Marketplace
- **Accelerated development:** Create robust applications in development cycles that are measured in weeks, rather than months or years
- **Reduced legacy costs:** Eliminate the burden of managing/upgrading legacy code
- **Wholly visual development:** Build and iterate mission-critical applications and workflows via an entirely visual UI
- **Robust integrations:** Seamlessly integrate new codeless software with existing systems (including those built with code) and third-party platforms.

High-level use cases

- Claims/complaints management
- Inventory management
- Regulatory compliance
- Case management
- Risk management/Authorization to operate

Specific use cases

- HR Onboarding/offboarding
- Ethics compliance
- Reasonable accommodations
- Investigation case management
- Training selection and scheduling

Key features

Integrate all of your systems & data

- Build an integrated source of truth for all of your business data
- Orchestrate and automate complex business processes and create modern, intuitive user experiences

Increase productivity through automation

- Automate business processes to make your teams more productive
- Flexible workflow models; control what end-users can do at both broad and granular levels

Create branded digital experiences at scale

- Deploy consumer-grade experiences to attract and delight internal stakeholders and users
- Build differentiated experiences quickly with flexible styling and reusable UI templates
